

1 1 CI/CD Pipeline for Attendance Application

Purpose

Auto deploy attendance system

AWS Services

CodePipeline

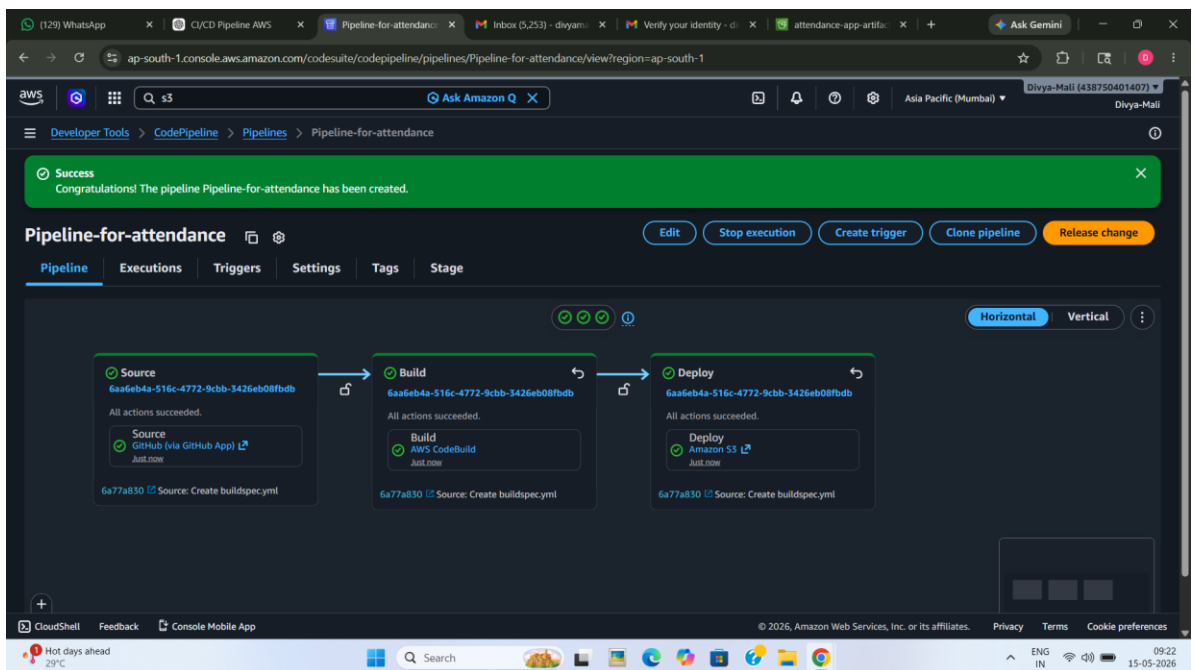

EC2 / S3

Attendance Application CI/CD

This project uses AWS CodePipeline, CodeBuild, and CodeDeploy for automated deployment to EC2.

AWS Services Used

- CodePipeline
- CodeBuild
- CodeDeploy
- EC2
- IAM
- GitHub

The screenshot displays the AWS CodePipeline console interface. At the top, a green success banner reads: "Success Congratulations! The pipeline Pipeline-for-attendance has been created." Below this, the pipeline details for "Pipeline-for-attendance" are shown. The pipeline consists of three stages: Source, Build, and Deploy. Each stage is represented by a box with a green checkmark and a status of "Just now". The Source stage uses "GitHub (via GitHub App)" as the provider. The Build stage uses "AWS CodeBuild". The Deploy stage uses "Amazon S3". The pipeline is currently in a "Success" state, indicated by three green circles at the top of the stage boxes. The console also shows tabs for "Executions", "Triggers", "Settings", "Tags", and "Stage". The bottom of the screen shows the Windows taskbar with the date and time as 09:22 on 15-05-2026.
